Campus / Group: Tetovo

MapOut – AI-Powered Travel Planner

Week 3: Intelligent Agents and PEAS

This week's planned objective

Define MapOut as an intelligent agent, prepare its PEAS specification, and design the initial system architecture.

What I completed

I defined MapOut as an intelligent travel-planning agent and prepared its PEAS specification, including performance measures, environment, actuators, and sensors. I also designed the initial system architecture and described the task-environment characteristics, using examples from Ohrid to explain how the system will work.

Evidence submitted

Week 3 report containing the PEAS specification, initial system architecture diagram, and task-environment description with practical examples.

What I can demonstrate now

I can explain how MapOut functions as an intelligent agent, describe its PEAS components, and demonstrate the proposed workflow using an example of a personalized trip to Ohrid.

Problem or failure encountered

The main challenge was defining a realistic project scope while considering different travel preferences, activities, and constraints. I addressed this by focusing the initial prototype on one destination.

Decision made this week

I decided to start with Ohrid, North Macedonia, because it offers a variety of historical, cultural, natural, and recreational activities. This will allow me to test different travel preferences before expanding to other destinations.

AI assistance used

I used ChatGPT (OpenAI) to clarify intelligent-agent concepts, review the PEAS specification, and improve the organization and wording of my documentation. I reviewed the suggestions and made the final decisions about the project structure and scope.

Feedback received

To be completed after receiving feedback.

Next week's objective

Create an initial dataset of attractions and activities in Ohrid, including categories, locations, estimated costs, and visit durations. Define the problem representation and develop a basic Python program to load and display the dataset.
